## Add Number Series II

### Programming challenge description:

Write a program that, given an integer  $N$ , sums all the whole numbers from 1 through  $N$  (both inclusive). Do not include in your sum any of the intermediate values (1 and  $N$  inclusive) that are divisible by 5 or 7.

### Input:

Your program should read lines from standard input. Each line contains a positive integer.

### Output:

For each line of input, print to standard output the sum of the integers from 1 through  $n$ , disregarding those divisible by 5 and 7. Print out each result on a new line.

### Test 1

#### Test Input

```
27
19
```

#### Expected Output

```
261
139
```

### Test 2

#### Test Input

```
7
```

#### Expected Output

```
16
```

### Test 3

#### Test Input

```
10
```

#### Expected Output

```
33
```

Challenge

## Stack Implementation

### Programming challenge description:

Write a program implementing a stack interface for integers. The interface should have 'push' and 'pop' functions. You will be asked to 'push' a series of integers and then 'pop' and print out every alternate integer.

### Input:

Your program should read lines of text from standard input. Each line contains a sequence of space delimited integers.

### Output:

For each line of input, use your stack interface to print to standard output a new sequence containing every alternate integer from the input in reverse order (space delimited), one sequence per line.

### Test 1

#### Test Input

1 2 3 4

#### Expected Output

4 2

### Test 2

#### Test Input

10 -2 3 4

#### Expected Output

4 -2

## Set Intersection

### Programming challenge description:

Find the intersection of two sorted lists of integers.

#### Input:

Your program should read lines of text from standard input. Each line will contain two comma separated lists of integers in ascending order, one pair of lists per line. The lists are separated by a semicolon.

#### Output:

For each pair of input lists, print to standard output their sorted intersection in ascending order, comma separated, one intersection per line.

### Test 1

Test Input

1,2,3,4;4,5,6

Expected Output

4

### Test 2

Test Input

7,8,9;8,9,10,11,12

Expected Output

8,9

## Number Pairs

### Programming challenge description:

You are given a sorted array of positive integers and a number X. Print out all pairs of numbers whose sum is equal to X. Print out only unique pairs and the pairs should be in ascending order

### Input:

Your program should read lines of text from standard input. Each line will contain a comma separated list of sorted numbers, followed by a semicolon, followed by the integer X.

### Output:

For each line of input, print to standard output the pairs of numbers that sum to X. Print the pairs in ascending order (the first number of each pair should be less than or equal to the second number). If no pair exists that sums to X, print the string NULL.

### Test 1

#### Test Input

```
1,2,3,4,6;5
```

#### Expected Output

```
1,4;2,3
```

### Test 2

#### Test Input

```
2,4,5,6,9,11,15;20
```

#### Expected Output

```
5,15;9,11
```

### Test 3

#### Test Input

```
1,2,3,4;50
```

#### Expected Output

```
NULL
```
